Benefits

dbQwikEdit offers many benefits to the novice and power user alike.

User Empowerment

Business users can gain access to their relational data with "zero" SQL knowledge. Empower them with information that has been "locked" away inside their databases and only accessible by using scarce programmer resources to query this data.

Simplicity of Use

dbQwikEdit excels at making the complex simple. Its unique visual query builder, and wizard functions make this a tool to all users. No hours of learning required. In addition, complex tasks are greatly simplified. Synchronizing data between databases is a point and click exercise, with built in error handling options. This task which typically takes programmers hours, is reduced to minutes.

Productivity Boosts

The magic of dbQwikEdit is the gains in productivity that you will see. Whether it is to change a data value, create database queries, design tables or synchronize data, you will save hours of effort. dbQwikEdit pays for itself within the first few hours of use.

Features

Database Explorer

dbQwikEdit opens your database into a explorer view. Tables, columns, Indexes, Views, Procedures are displayed as you are accustomed to see in windows explorer. Table lists can be filtered to quickly locate the tables in large databases.

DataGrid

The data grid presents table data in a spread sheet style. To edit or add new data, you simply need to type in the new data. You can filter and sort data, order columns, to create and print real time reports. These settings can be saved and re-applied to the table at a later date. You can even use the filtering and sorting to visualize your desired data, and with a click of a button to generate the SQL query to be customized or saved.

Visual Query Builder

Our visual query builder makes creating queries trivial. Drop tables into the query, drag columns to join tables, select columns, sorts, filters with ease.

You can save and open visual queries, so you never have to rebuild a query. Power users can further customize queries by generating the SQL into the SQL syntax builder.

Don't be fooled by the ease of use, Visual Query builder is a workhorse, with plenty of powerful features, like setting properties of joins to generate inner / outer join syntax, table/column aliasing calculated fields, and much more.

SQL Syntax Builder

For power users and SQL experts, our SQL Syntax builder will give you full control over our SQL. This hybrid, type/point-and-click tool speeds the building of SQL statements. With syntax highlighting, query history, search and replace, and customizable syntax menus. The integrated parameter builder allows you to create parameterized queries. Power users will find a wealth of tools to suit even the most advanced requirement.

Data Security

dbQwikEdit is a tool for all users. We have added connection read-only mode that can be password protected. This is great for preventing accidental updates to data or releasing all the great data mining features to a wide variety of users without jeopardizing your data.

Export

Export query results in many popular desktop and exchange formats. Send data to clients, analysts, or friends in easily importable formats including: MS Excel, HTML, SQL, Comma Delimited, RTF, DIF, LaTeX, SYLK, MS Word, and Text files.

This is also a great way to get data into programs to report, chart, analyze, format, mail merge, or print.

Data Synchronization

Moving data between databases has historically been a tedious task that only highly trained database experts can perform. dbQwikEdit makes that task as easy as choosing a source and destination table.

dbQwikEdit batch move is more than a table-to-table data migration tool, you can use it to move subsets of data, add, update or delete selected record sets. You can even map data between columns with different names.

Robustness

On first looks dbQwikEdit may appear to be a desktop tool, and it is, but there is advanced features and a robust engine under the surface to suite even the most demanding corporate user. dbQwikEdit is able to run concurrent sessions and concurrent queries in each sessions. dbQwikEdit batch data move throughput has been benched marked in test with IBM to over 1000 transactions per minute.

dbQwikEdit is an industrial strength software solution suitable to any environment.

Command Line Interface

dbQwikEdit supports a command line interface allowing you to initiate partial or fully automated jobs. This powerful feature is especially useful in setting up batch synchronization jobs. However, there are many additional uses. Set up desktop shortcuts to open and execute queries to speed repetitive tasks. Use dbQwikEdit to create weekly or monthly export files. Even call it from other programs.
